

Monophonic vs Polyphony

Timbre in music????

Polyphonic Timbre

Global sound

Polyphonic Timbre

Global sound

musical genres typically
contain prototypical
sound mixtures which
then describes the
global sound

composers also tend to have their own “sound” because of their choice of instruments

Global Sound/Polyphonic Timbre Significance

Perceptual

- genre identification and categorization (250ms-3s) (Gjerdingen & Perrott in 1999)
- affect identification (500 ms) (Peretz et al. 1998)
- agree on basic emotions(1-2sec) (Bigand et al. 2005, Watt & Ash, 1998)

Computational (MFCC)

- genre(Tzanetakis et al.,2001, Aucouturier, 2006) ,
- mood, emotion (Liu et al., Yang & Lee, Leman et al.)
- semantics (Turnbull et al,2008, Slaney, 2002)

Global Sound/Polyphonic Timbre Significance

“spectrum-of-a-spectrum”

Computational (MFCC)

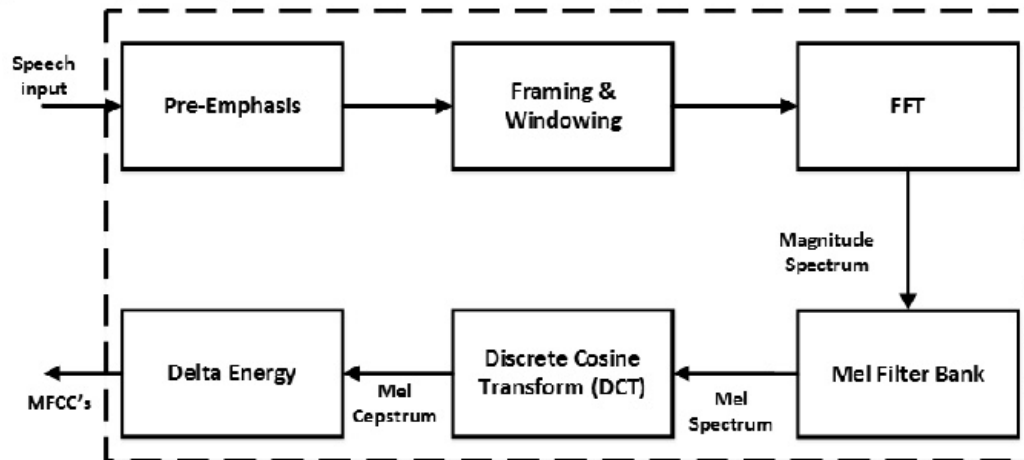

Fig. 2. Block Diagram for MFCC Computation

- descriptor of spectral shape based on perception
- widely used in speech research (e.g. speech recognition)
- perceptual correlates unclear

- genre (Tzanetakis et al., 2001, Aucouturier, 2006) ,
- mood, emotion (Liu et al., Yang & Lee, Leman et al.)
- semantics (Turnbull et al., 2008, Slaney, 2002)

Perceptual dimensions

What do we perceive/hear when we listen to short bursts of music

What are the latent dimensions

Research Questions

- Which terms are used to describe polyphonic timbre?
- Are these terms used consistently?
- Can they be predicted from acoustical features?

Alluri, V. and Toiviainen, P. (2010). Exploring **perceptual** and **acoustic** correlates of polyphonic timbre. *Music Perception*, 27(3):223–241

Perceptual and Acoustic Correlates of Polyphonic Timbre

- Experiment 1
 - Devise framework for quantitative assessments
- Experiment 2
 - Evaluate excerpts and uncover underlying perceptual dimensions
 - Acoustic correlates

Perceptual and Acoustic Correlates of Polyphonic Timbre

- semantic associations comparable to those of monophonic timbre

Colorful-Colorless
Warm-Cold
Dark-Bright
Acoustic-Synthetic
Soft-Hard
Strong-Weak
Empty-Full
High Energy-Low
Energy

Perceptual dimensions

Activity

Low Activity

High Activity

Brightness

Low Brightness

High Brightness

Fullness

Low Fullness

High Fullness

Acoustic features

Temporal

- zero-crossing rate

Spectrotemporal

- roughness
- ***sub-band flux***

Spectral

- centroid
- high energy-low energy ratio
- entropy
- roll-off 85
- MFCC

Sub-band Flux

Acoustic Correlates

- acoustic correlates : subband fluxes (spectrotemporal modulations) are best predictors
- **Activity** dimension can be predicted most accurately with acoustical features
- MFCCs fail to predict

Fullness

Activity

Brightness

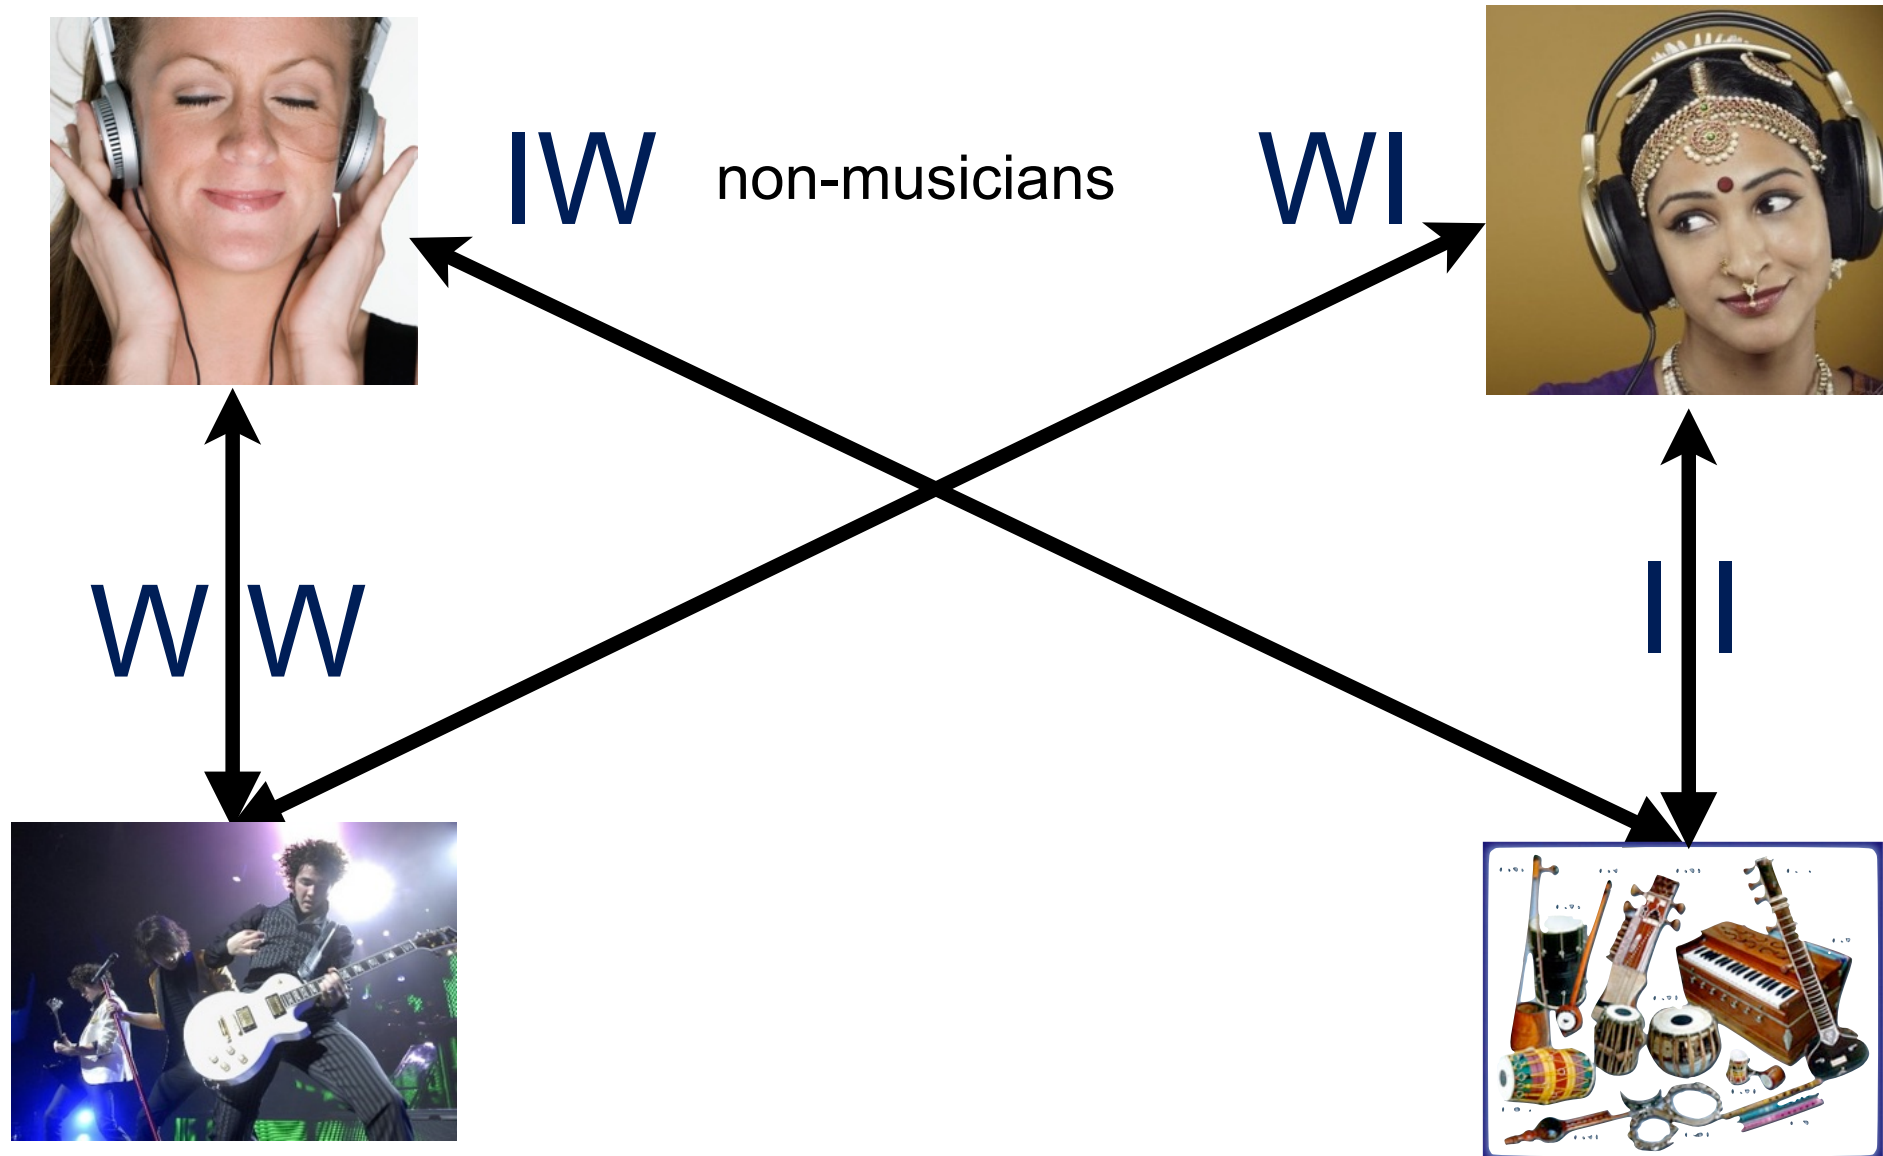

low

mid

high

- so the Finns rated a bunch of Indian audio samples
- does that mean that our perception of global sound is the same?

Study 2 : Effect of enculturation on semantic and acoustic correlates of polyphonic timbre

Correlation Between Listener Groups

Intrinsic Dimensionality

Factor Analysis (Kaiser criterion)

	II	IW	WI	WW
No. of factors	3	2	2	3

familiarity

- increases dimensionality of perceptual timbre space
- enhances perceptual acuity

Perceptual Dimensions

 High Brightness Scores

 Low Brightness Scores

Perceptual Dimensions

 High Activity Scores

 Low Activity Scores

Acoustic Feature Correlation

Acoustic Feature Correlation

Activity

Conclusion

- Overall results hint at the existence of universal patterns in polyphonic timbre perception
 - **Activity, Brightness** - common perceptual dimensions
- increase in intrinsic dimensionality
 - enculturation
 - musical expertise

can genre, emotion
be identified based
on these two
dimensions?

Dual Pathways in the brain

- represent the “**where**” and “**what**” of the sound
- postero-dorsal stream encompasses both **spatial** and **language** functions
- antero-ventral auditory pathway important in **auditory pattern recognition** and **object identification** and is **hierarchically** organized

Rauschecker and Scott, 2009

“hierarchical”

- levels of abstraction
- basis to hypothesise where timbre is encoded in the brain

levels of abstraction

- **low** levels associated with representation of acoustic structure
- **high** levels associated with representation of sound source properties
- **higher** levels associated with identification, description, and categorization of prototypical mixtures of sources (**polyphonic timbre**/global sound)

“What” Pathway in the brain

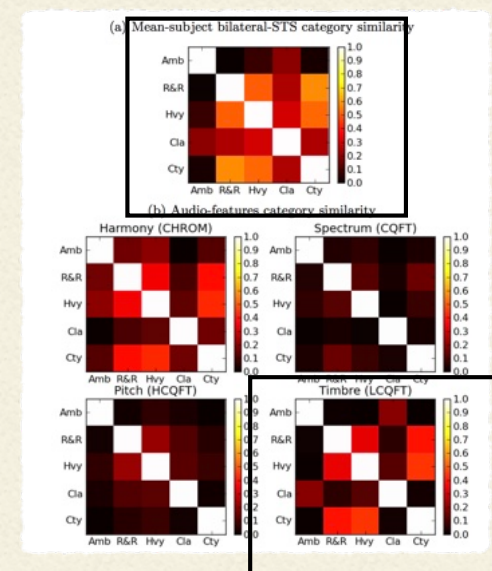

modelling: **decoding genre**

modelling: **decoding genre**

- MVPA restricted to bilateral **STS**
- highest correlation representation similarity analysis (RSA) matrix of **timbral features** (cepstral features - “the way the stimulus sounds”) with that of **STS** than tonality and pitch
- “distributed population code in bilateral **STS** responsible for genre discrimination”
- timbral features were most accurate in predicting the image response

Music of the 7Ts: Predicting and Decoding Multivoxel fMRI Responses with Acoustic, Schematic, and Categorical Music Features

*Michael A. Casey**

Bregman Music and Audio Lab, Computer Science and Music Departments, Dartmouth College, Hanover, NH, United States

- song & genre decoding from fMRI
- Forrest database
 - 7 tesla scanner
 - 20 participants
 - 25 excerpts (6-sec), 5 genres
- ROIs: Heschl's gyrus, anterior STG, posterior STG
- Support Vector Machine classifier

modelling: **decoding genre**

- restricted to bilateral **HG** and **STG**
- **STG** predicted better than **HG** perceptual genre classifications

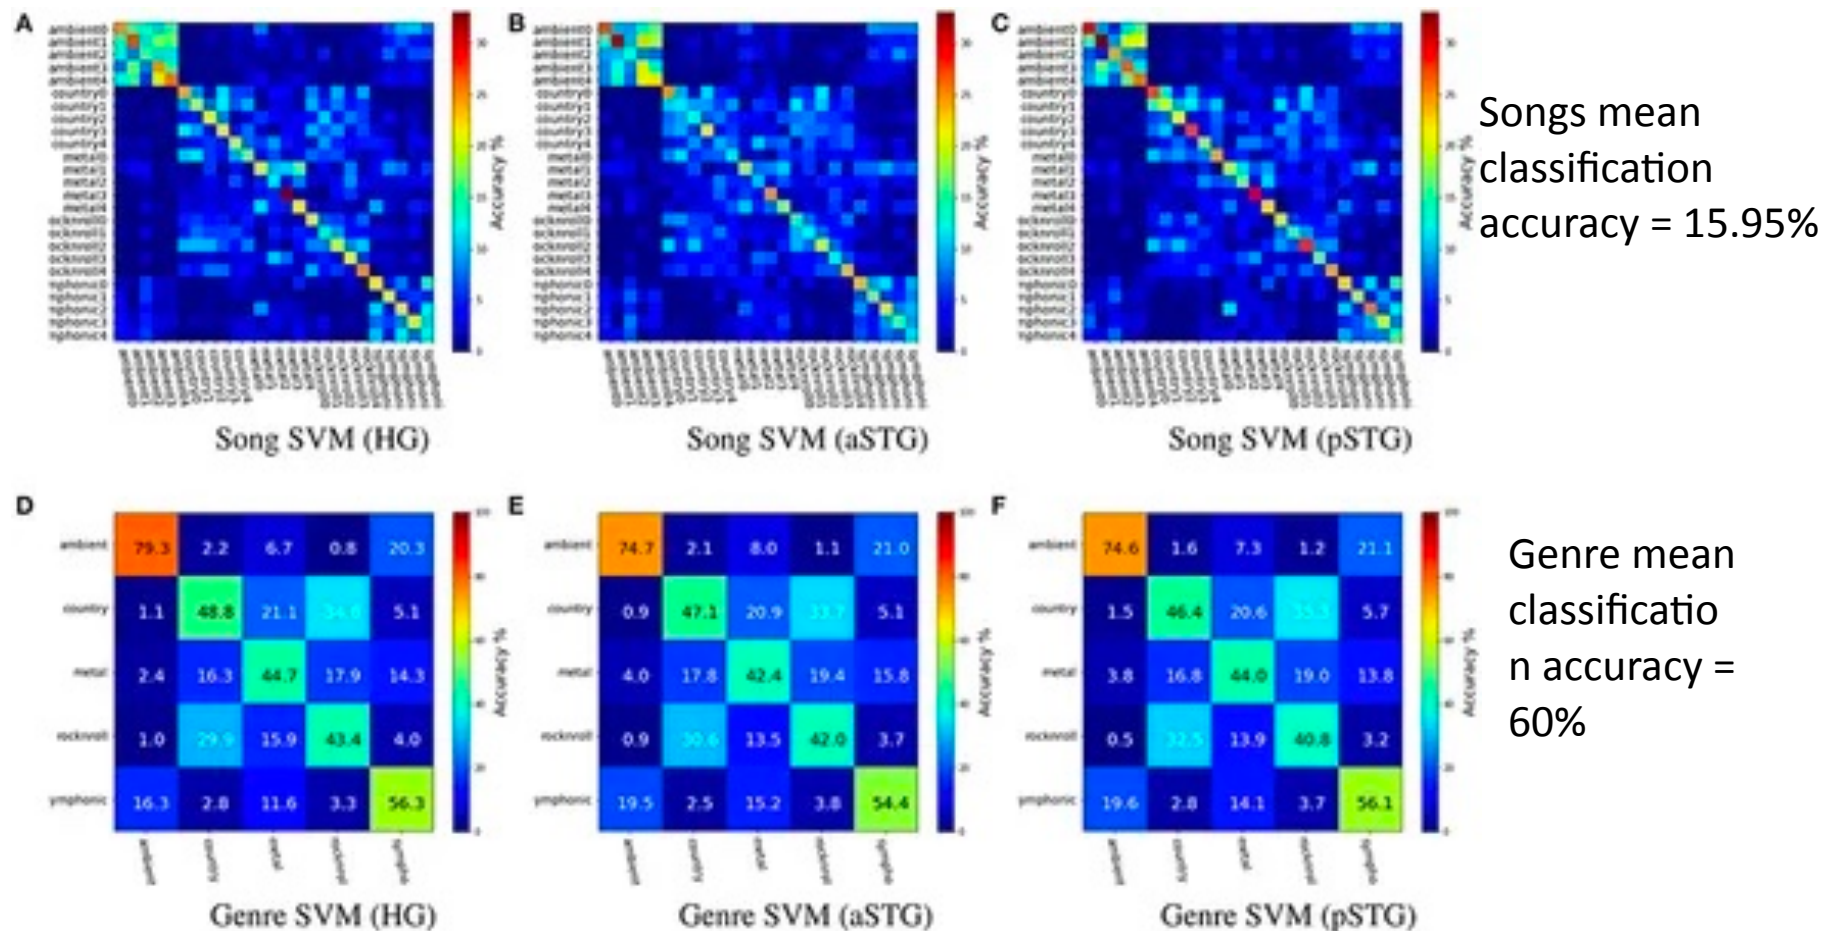

Primary and Secondary
auditory cortex

results / song classification

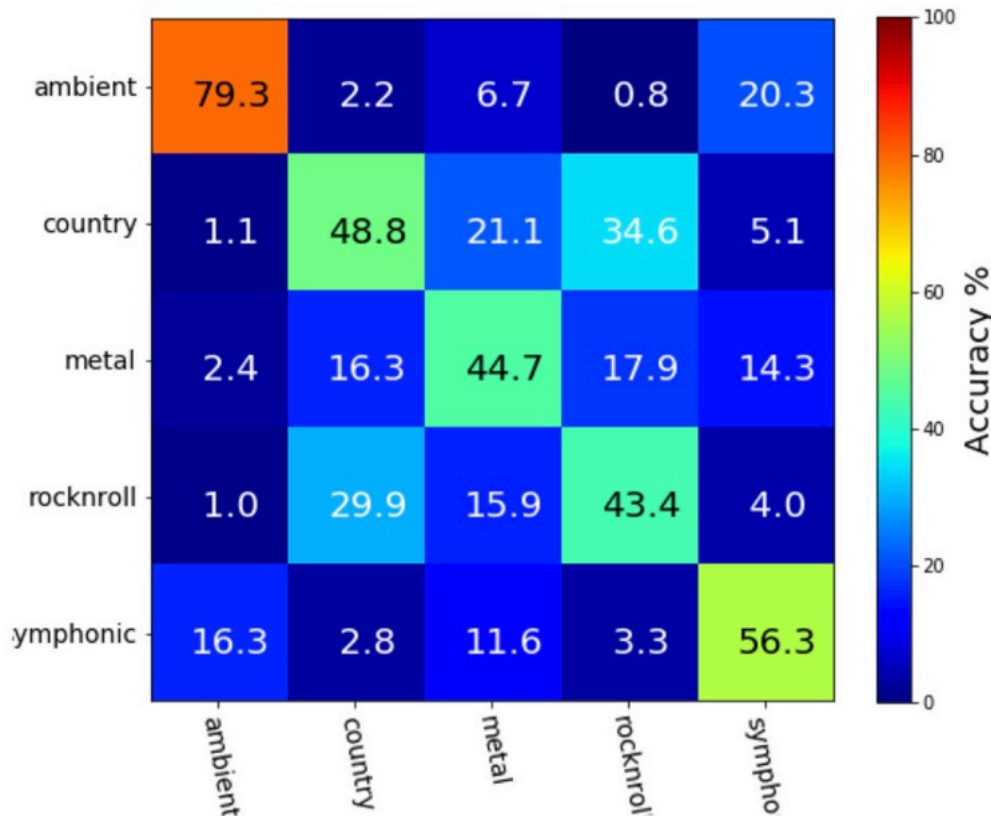

Song SVM (HG)

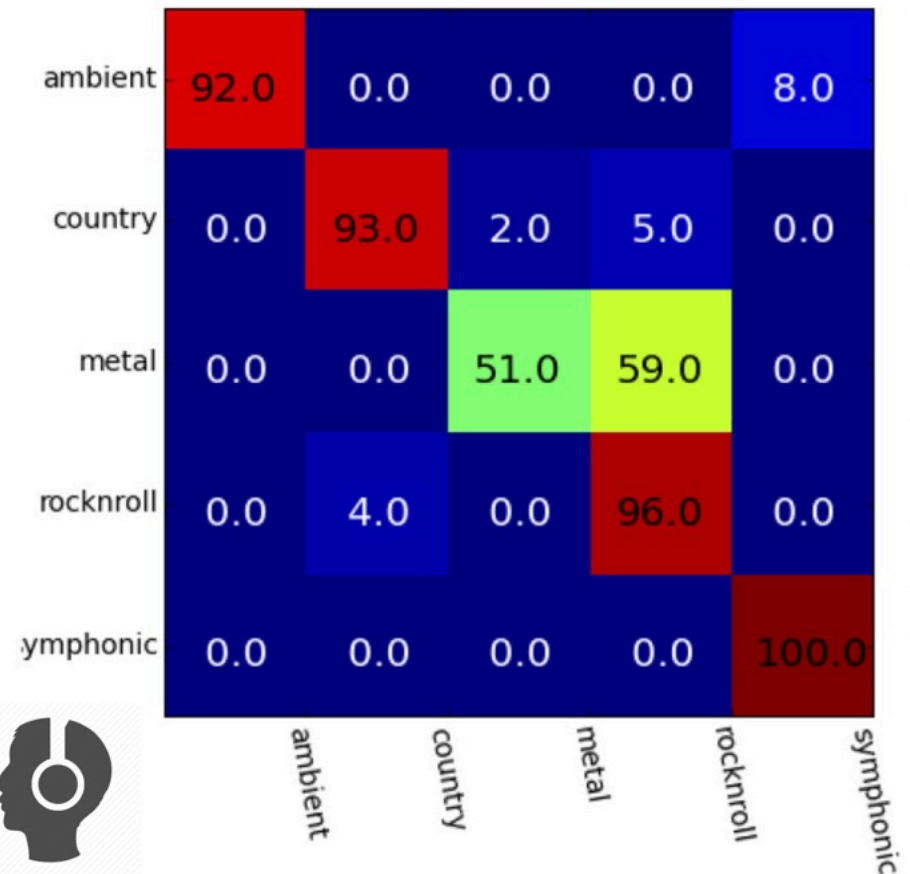

The figures show that distinct anatomical ROIs yield similar relational information about music. The patterns of misclassifications show that when songs are misclassified, they are more likely to be confused with items from the same genre, or a similar sounding genre: e.g., Ambient and Symphonic; and Rock-n-Roll and Country.

results / genre classification

Genre SVM (HG)

—> the pattern of confusions exhibited by the classifiers was significantly correlated with confusions in a behavioral categorization task
